

Fusion Edge Overview

Join the Fight Against Ransomware

FusionEdge lets companies band together and share global cybercrime threat intelligence so you can act first.

Why It Works

Ghost Sensors

- Similar to a honeypot, Ghost Sensors are secure decoys that attract, observe, and report malicious activity in a contained environment.

Collection

- Threat Intel is collected from Ghost Sensors and high-value sources from around the world.

Analysis

- Intel is updated in near real-time with the most current attack data to currate a networked defense.

Response

- FusionEdge's curated shun list is automatically deployed for your firewall, IDPS/IPS or SIEM for immediate protection.

**No bloated blocklists or obsolete data,
FusionEdge gives you an adaptive, networked defense.**

Ghost Sensors

- **No PII captured** – privacy-respecting by design.
- **Rapid volume** – a single sensor can report 1,000+ malicious IPs in a day.
- **Secure and isolated** – deploy without disrupting production traffic.
